Why Fungibility Matters

Why Fungibility Matters

History of Privacy

In the beginning, people thought Bitcoin was private because addresses did not directly reveal any information about the controller

Evaluating Privacy Technology

Monero contributors know that our code:

- Is responsible for securing people's money
- May need to protect someone's life savings
- May need to keep an innocent person out of jail
- May mean the difference between life or death

A Brief History

Regulatory Compliance and Transparency

(with the View Key)

Transparency

A view key is used to reveal all transactions for a Monero account, or just the key for a single transaction

Selected Parties

View keys can be given to selected parties, or can be made public

Auditing

Auditors can be given access to accounts without being able to spend those account funds

Charities

By publishing their view key, charities can invite easy public oversight

Parents

Children can be given their own accounts, and parents can monitor their spending

Monero Limitations

Monero Limitations

Monero Limitations

Monero Limitations

Addressing Transaction Size

1. Large hard drives are cheap, and prices continue to fall (even if it can't meet Moore's Law)
2. Prune non-essential parts of blockchain for 50% size reduction. Sharding possible
3. RingCT is brand new; optimizations could reduce transaction sizes by 20%
4. Any real scaling needs to be done off-chain anyway

Roadmap and Ongoing Development

Roadmap and Ongoing Development
