

Bitcoin and Blockchain

Who Am I?

Minnesota Cryptocurrency

MONERO

What is a blockchain?

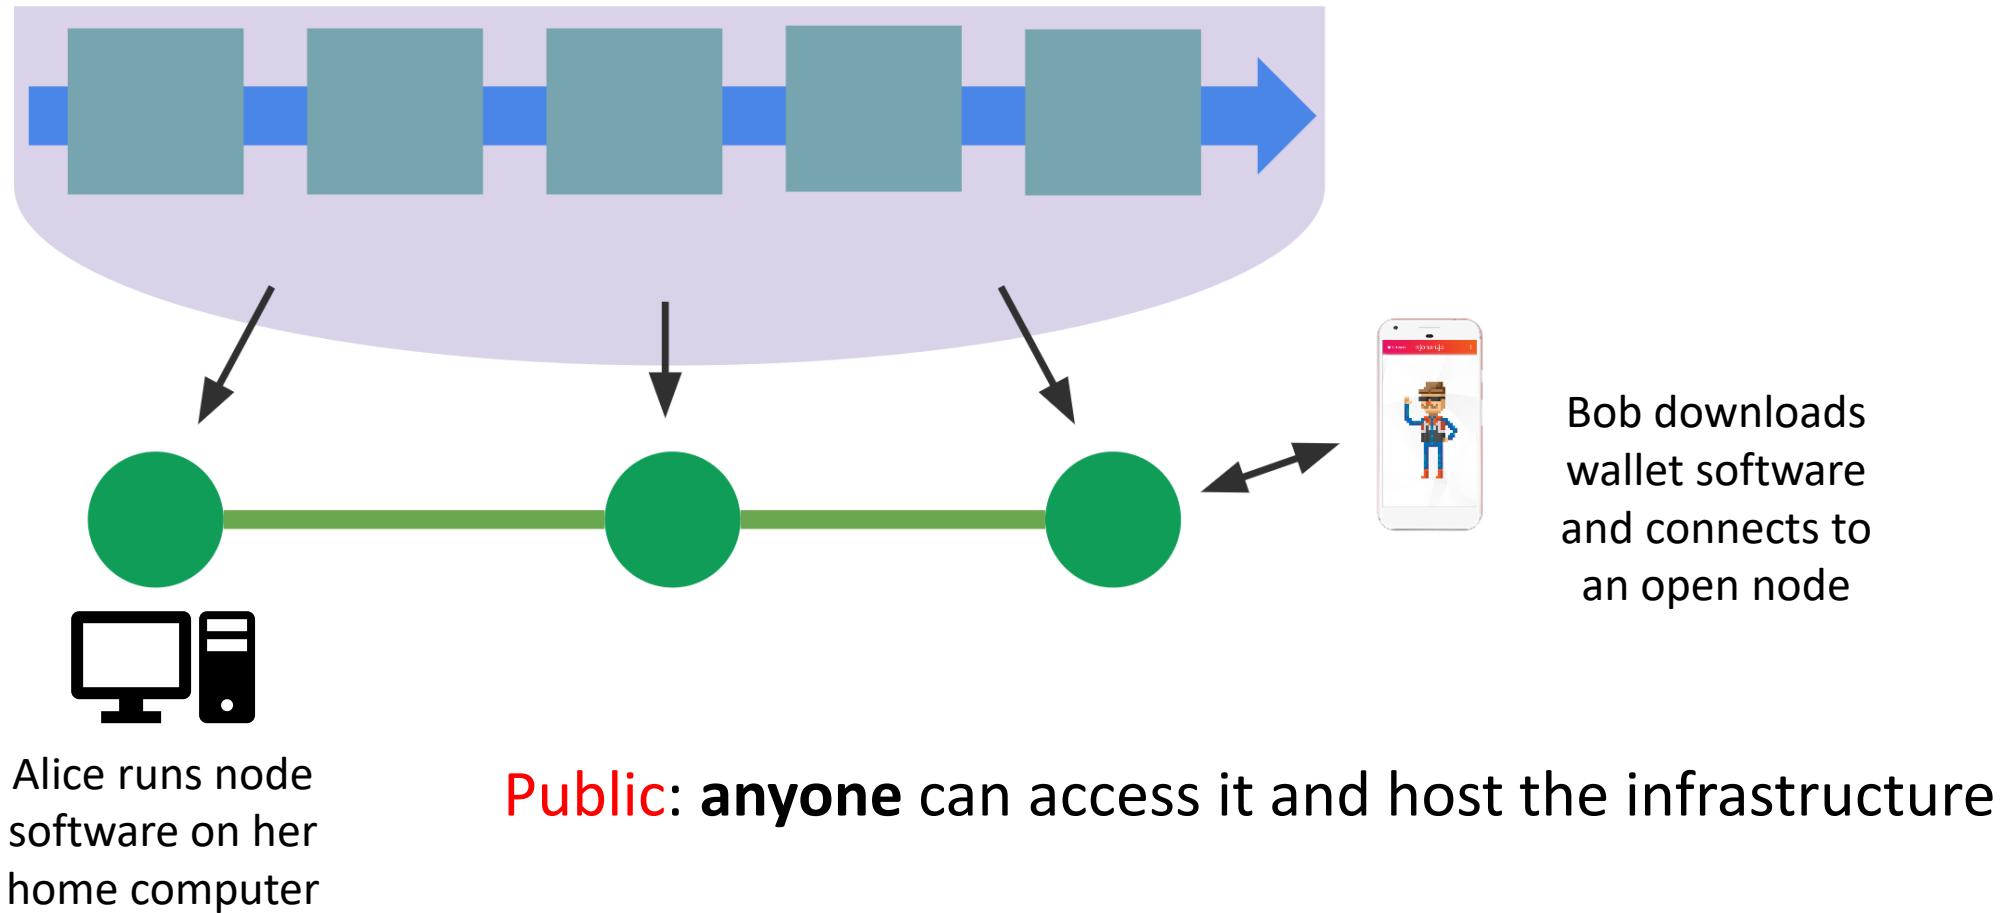

A blockchain is a distributed, growing database

Each *block* contains data. These blocks form a *chain*.

The blockchain is stored on *nodes*, which share the copy.

Public vs. Private Blockchains

Public vs. **Private** Blockchains

Discussion: Advantages and Disadvantages

1. What are some pros and cons to decentralized systems?
2. What are pros and cons of using a blockchain?

Real problems, real solutions

1. I need an asset with predictable supply
2. I need an asset where funds are secure against attack
3. I need an asset where funds are kept private
4. I need access to a global economy
5. I need project code or contracts that are immutable
6. I need an auditable public record
7. I need to prove something without revealing why it's true

Mini lesson: zero-knowledge proofs

Quick Demo

Sending cryptocurrency transactions is similar to sending Venmo transactions, but people don't really get it until they see it.

Myth: it takes 10 minutes to send a transaction. It takes time for it to be *confirmed*, but transactions will likely be included. You don't need to wait that time for small transactions.

Institutional Adoption

1. Futures, forwards, and options
2. Clearer IRS guidelines
3. Clearer exchange compliance guidelines
4. More ICO regulation
5. Negative associations decreasing

FEATURE

China and Hong Kong

1. Extremely difficult to assess accuracy of reports
2. Difficult to assess accuracy of project claims
3. High proportion of scams in the region
4. Chinese government imposes strict technology regulations
5. Chinese mining is a topic of debate

In China, bitcoin mining moguls are scrambling to survive

Cryptocurrency miners have been making millions in digital currency from China's excess energy. Now, a government crackdown could end the gold rush

By **BARCLAY BRAM**

Monday 15 April 2019

Key takeaways:

- Mining is cheaper in China than most other parts of the world, since electricity is cheap and chip production occurs locally
- China has banned purchases of **cryptocurrencies on exchanges**, leading to a strong OTC market
- Mining is the main way to invest in cryptocurrencies in China, since there are few other options to earn it
- China has strict controls on the ability to transfer money abroad, and cryptocurrencies challenge these regulations
- China has strict controls on the internet

HONG KONG

MONEY LAUNDERING AND TERRORIST FINANCING RISK ASSESSMENT REPORT

April 2018

Key takeaways:

- Hong Kong has no capital controls, so cryptocurrencies are less used compared to companies with strict capital controls
- In-person trades are not popular
- Cryptocurrencies were seen used as a pretext for ponzi schemes and as payment for criminal activity
- “Although there is inherent ML/TF vulnerability related to VCs, there does not seem to be any visible impact affecting the overall risk in Hong Kong so far. The risk of VCs is assessed as medium-low”

What to do

1. Remain skeptical
2. Watch for efficiency and privacy improvements
3. Ask “why not use a centralized database?”
4. Demand more clarity from representatives
5. Come to club meetings if interested
6. Mine in dorm with free power :)

Thank You!
